the ICCT: mission and activities

The mission of ICCT is to dramatically improve the environmental performance and efficiency of cars, trucks, buses and transportation systems in order to protect and improve public health, the environment, and quality of life.

- Non-profit research organization
- Air pollution and climate impacts
- Focus on regulatory policies and fiscal incentives
- Activity across modes including aviation and marine
- Global outreach, with special focus on largest markets

Index

- Global Emissions and Vehicle Standards
- Technical Approaches for Compliance
- In-Use Diesel NOx Emissions

Global Emissions and Vehicle Standards

LDV Standards Timeline

LIGHT-DUTY VEHICLE POLICY TIMELINES

Baseline Standards ■ Pre-Euro ■ Euro 1 ■ Euro 2 ■ Euro 3 ■ Euro 4 ■ Euro 5 ■ Euro 6

Accelerated Standards ● 4 Euro 4 ● 5 Euro 5 ● 6 Euro 6 ● NG Next-Generation

...they drive convergence in average emission levels...

...they make a difference in air quality...

Technical Approaches for Compliance

Background

ICCT Study of Cost of Emission Control Technologies

- Standards are spreading around the globe
- Cost of adopting new technologies in LDVs is a prominent issue during regulatory negotiations worldwide
- Existing cost estimates were primarily from LEVII/Tier 2 rulemakings – over a decade out of date

	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Brazil	PROCONVE L-3		PROCONVE L-4		PROCONVE L-5				PROCONVE L-6	
China ⁽¹⁾	China II		China III			China IV				
Europe	Euro 4				Euro 5				Euro 6	
India ⁽¹⁾	Bharat II				Bharat III					
Japan	FY 2005 Emission Regulation				Post New Long Term Emission Regulation					
Mexico	Standard A (US 1994)				Standard B: Tier 2 Bin 10, 11 / Euro 4-Euro 3 (diesel)				Standard C ⁽²⁾	
Russia	Euro 1	Euro 2				Euro 3		Euro 4

LDDV NOx Standards in Europe are not as stringent as LDGV

Emission Control Technologies: Gasoline

In-cylinder	Aftertreatment
<ul style="list-style-type: none">• Air-Fuel ratio control<ul style="list-style-type: none">• Fuel injection (TBI or MPI)• O₂ sensor (O2S, HO2S, UEGO)• Geometry<ul style="list-style-type: none">• Reduce crevices• Intake ports• Spark plug position• EGR	<ul style="list-style-type: none">• Three-Way Catalyst (TWC)<ul style="list-style-type: none">• NO_x, HC, CO• PM generally not an issue with port injected, but could become on GDI. Gasoline Particulate Filters (GPF)

PAPER # 2013-01-0534

Emission Control Technologies: Diesel

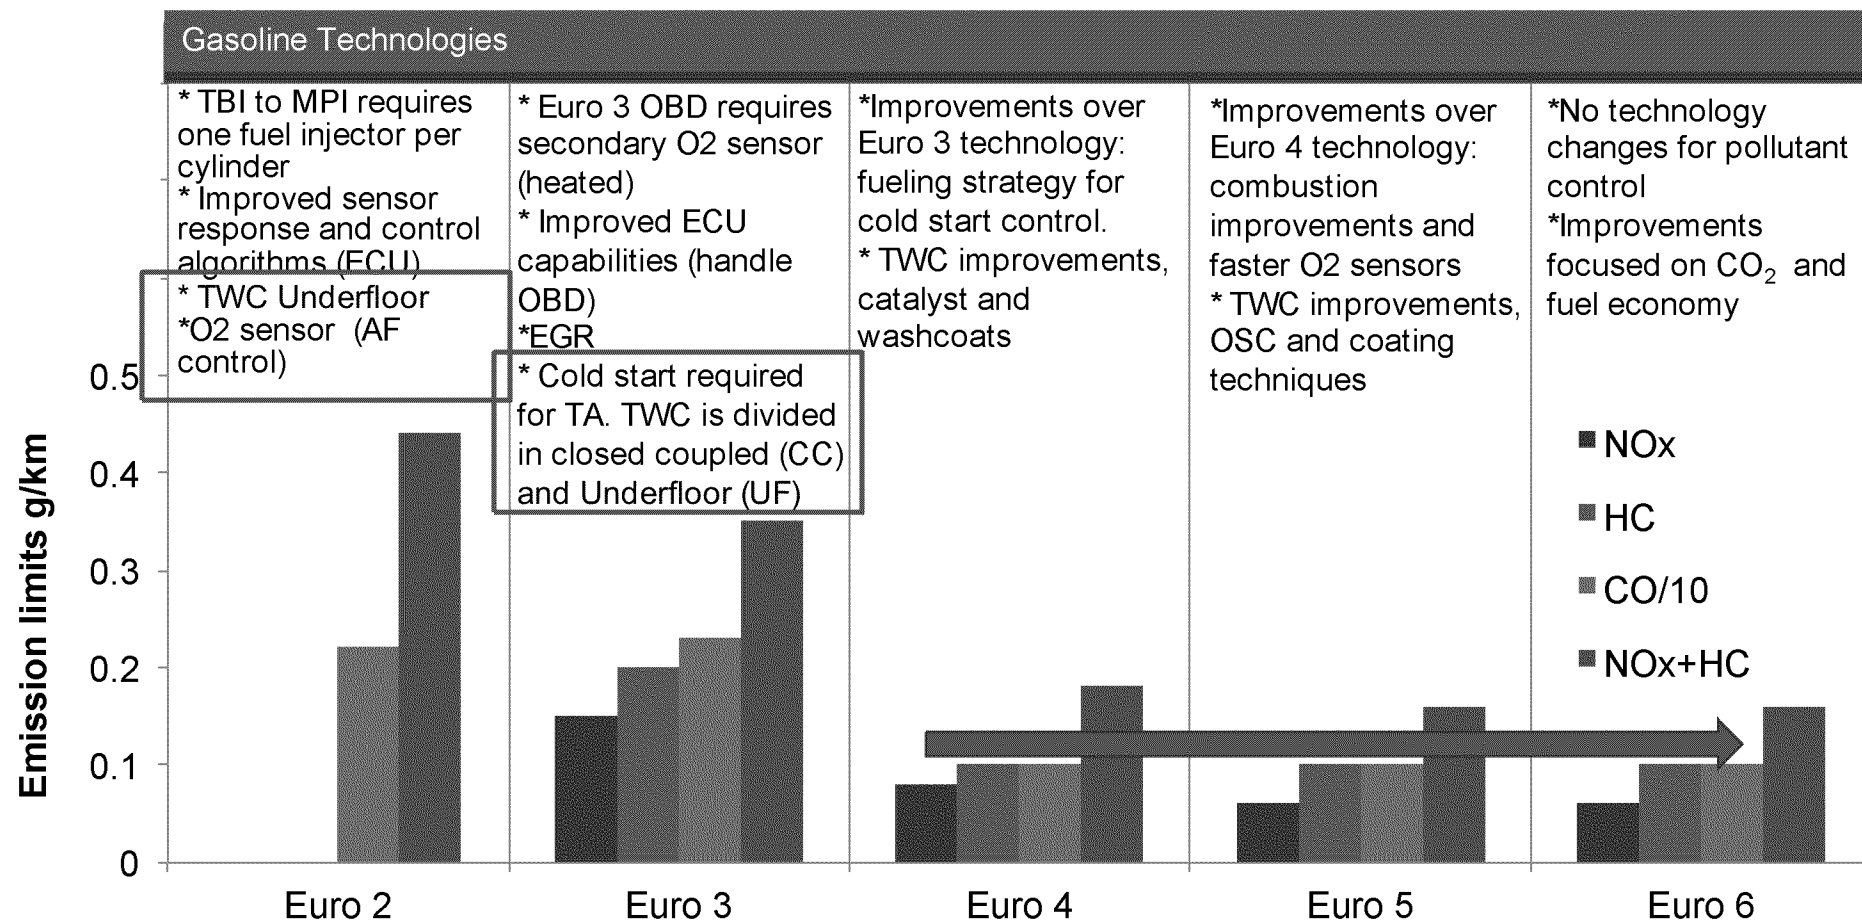

In-cylinder

- Air-fuel management syst.
 - Rotary pump, Common-rail
 - Direct or Indirect Inj.
 - Low or High pressure
 - Turbocharging with intercooling
 - Variable geometry turbo (VGT)
 - Variable valve timing (VVT)
- Geometry
 - Nozzle (sac vol., #holes, etc)
 - Comb. chamber
- EGR system -NOx Control
 - Mechanic or Electronic
 - Cooled or not

Aftertreatment

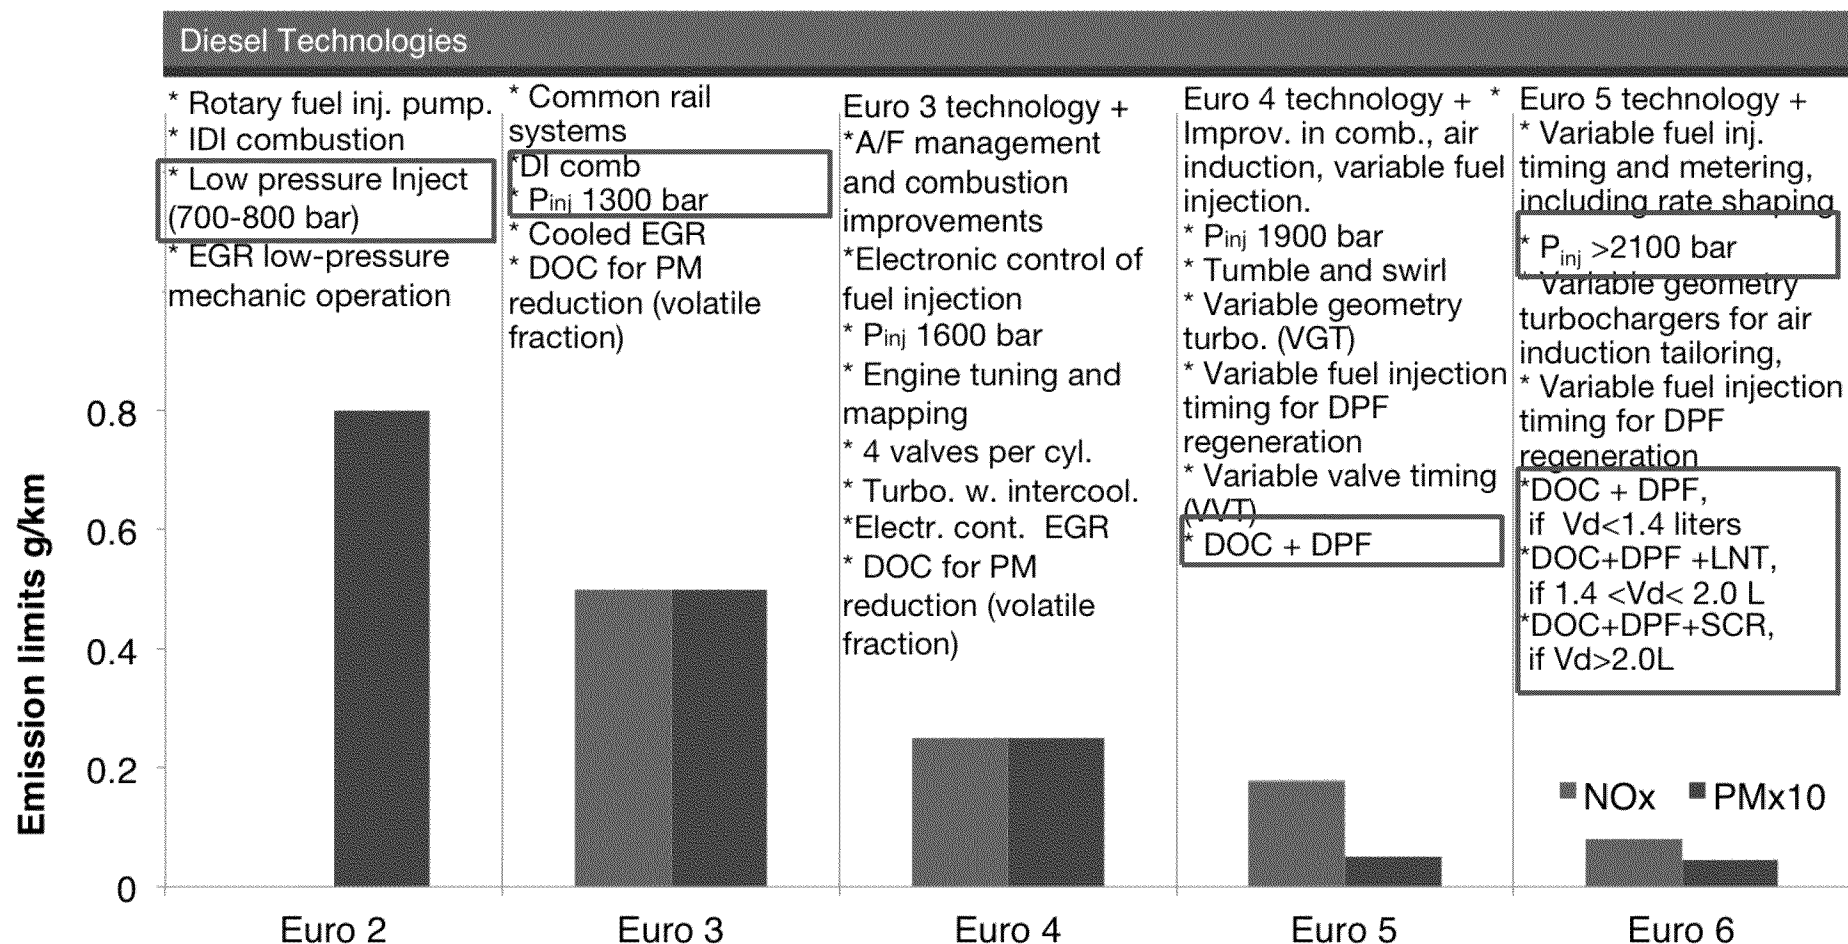

- Diesel Oxidation Catalyst (DOC)
 - CO (90%), HC (70%)
 - SOF fraction of PM (10-50%)
- Diesel Particulate Filter (DPF)
 - PM (95%)
 - PN
- Lean NOx Trap (LNT)
 - NOx (70-90%)
 - Require ULSD
- Selective Catalytic Reduction (SCR)
 - NOx (95%)

PAPER # 2013-01-0534

Diesel LDV Technology Costs

Example: Aftertreatment control system costs

SCR System, $V_d = 2.0$ L

No	Cost Item	
1	Average engine displacement, V_d , liters	2.0
2	Catalyst volume, CV (SVR=1.0), liters	2.0
3	Pt, Pd, and Rh are not required for NOx control	\$0
4	NH3 catalyst, CV (SVR=0.2), 1 g/L PGM @ \$43/g	\$17
5	Total PGM ([3]+[4])	\$17
6	Substrate and washcoat (\$20/L*CV)	\$40
7	Canning (\$15*CV)	\$30
8	Total SCR catalysts: PGMs + substrate+ washcoat	\$87
9	Urea tank volume ($8 \cdot V_d$), liters	16
10	Urea tank cost	\$114
11	Urea level sensor (\$60 commercial price/2.5)	\$24
12	Urea tank accessories (brackets, bolts, spacers)	\$15
13	Urea pump (\$130 commercial price/2.5)	\$52
14	Urea injector (\$86 commercial price/2.5)	\$34
15	Tubing Stainless Steel (\$35 commercial price/2.5)	\$14
16	Urea Injection pipe section D2.5"x38cm	\$14
17	Urea Injection mounting parts (brackets, bolts, gaskets, spacers, tubing connectors)	\$15
18	Urea heating system- 200 W, 12 V DC.	\$40
19	Temperature sensors (x2)	\$42
20	Urea mixer	\$50
21	Total Urea System ([9]+[10]+...+[20])	\$414
22	Total Manufacturing: SCR Cat and urea syst.	\$501
23	Labor costs with overhead	\$48
24	Total Direct Costs to Manufacturing ([22]+[23])	\$549
25	Long term cost ($0.8 \cdot [24]$)	\$440

Detailed part cost estimations was done for each aftertreatment system: DOC, DPF, LNT and SCR

System	Cost = $f(V_d)$
DOC	$\$DOC(V_d) = 37 \cdot V_d + 6$
DPF	$\$DPF(V_d) = 135 \cdot V_d + 53$
LNT	$\$LNT(V_d) = 188 \cdot V_d + 27$
SCR	$\$SCR(V_d) = 72 \cdot V_d + 297$

Diesel LDV Technology Costs

Estimated costs of emission control technologies for European diesel LDVs, 2.0 L I4

Cost item	Regulation	EU					
		Euro 1	Euro 2	Euro 3	Euro 4	Euro 5	Euro 6
1. A/F control & engine-out emissions							
Fuel system - 50% of cost (a)	-		\$50	\$323	\$355	\$390	\$429
Turbocharger - 50% of cost (b)	-				\$75	\$75	\$138
Intercooler - 50% of costs (b)	-				\$32	\$32	\$32
VGT (extra cost) - 50% of costs (b)	-						\$55
EGR valves (c)	\$30	\$30	\$30	\$30	\$38	\$38	\$38
EGR cooling system (c)			\$36	\$36	\$44	\$51	\$58
Engine mapping and tuning (d)	-		R&D	R&D	R&D	R&D	R&D
Improvements on combustion chamber & nozzle geometry (e)	-		R&D	R&D	R&D	R&D	R&D
Cost of A/F control & engine-out emissions		\$30	\$116	\$389	\$543	\$586	\$750
2. Aftertreatment systems							
Diesel oxidation catalyst (DOC) (f)	-		-	\$78	\$78	\$78	\$78
Diesel particulate filter (DPF) (f)	-		-	-	-	\$322	\$322
Lean NOx trap (LNT) (f)	-		-	-	-	-	\$402
Selective catalytic reduction (SCR) (g)	-		-	-	-	-	-
Cost of aftertreatment systems (h)		\$0	\$0	\$78	\$78	\$400	\$802
3. Total cost of hardware [1+2]		\$30	\$116	\$467	\$621	\$986	\$1,552
4. Fixed costs (R&D, tooling, certification)		\$26	\$26	\$51	\$51	\$51	\$51
5. Total cost of emissions control tech [3+4]		\$56	\$142	\$518	\$672	\$1,037	\$1,603

Estimated cost of LDV emission control technologies

Estimated direct manufacturing emission control technology cost for gasoline and diesel LDVs assuming a 2.0 L engine

U.S. Tier 3 Emission Standards

US: Tier 3 Light Duty Emission Standards

(March 2014)

- Each Tier 3 bin has a NMOG+NO_x standard, as well as CO and HCHO standards
- 80% reduction in NMHC+NOX
- 70% reduction in PM
- New evaporative requirements
- 150k mile useful life (up from 120k)

Test cycle	Vehicle Class ¹	Tier 2	Model Year								
		2016 ^a	2017 ^b	2018	2019	2020	2021	2022	2023	2024	2025+
FTP	LDV/LDT1 ^b	160	86	79	72	65	58	51	44	37	30
FTP	LDT2,3,4 and MDPV	160	101	92	83	74	65	56	47	38	30

Fleet-average NMOG+NO_x (FTP), by model year

US: Tier 3 Emissions Compliance

(March 2014)

- \$72 per vehicle incremental cost after full phase-in:
 - Increased catalyst loadings (all vehicles)
 - Improved air/fuel control, particularly at cold start (all)
 - Optimized close-coupled catalyst (~60%)
 - Optimized thermal management (~40%)
 - Passive HC adsorbers (<5%)
 - Secondary air injection systems (~25% initially, then ramps down to <5%)
 - Improved evaporative emissions systems (all)

Tier 3 SFTP HC+NO_x Standards versus Current Tier 2 Bin 2/3 Vehicles

2017 Standard = 103 mg/mi: more than 10 times current emission levels

Figure 1-5: Mean and Maximum Composite SFTP Results for HC+NO_x for Test Groups certified to Bin-2 and Bin-3 Standards (bars and error-bars represent means and maxima for sets of test groups, respectively)

Graph from EPA RIA for Tier 3 proposed rule

In-Use Diesel NOx Emissions

On-road emissions of nitrogen oxides (NO_x) from 15 Euro 6/Tier 2-B5 LDDVs measured by PEMS

Compiled EU and US data

Real-world exhaust emissions from modern diesel cars, October 11, 2014

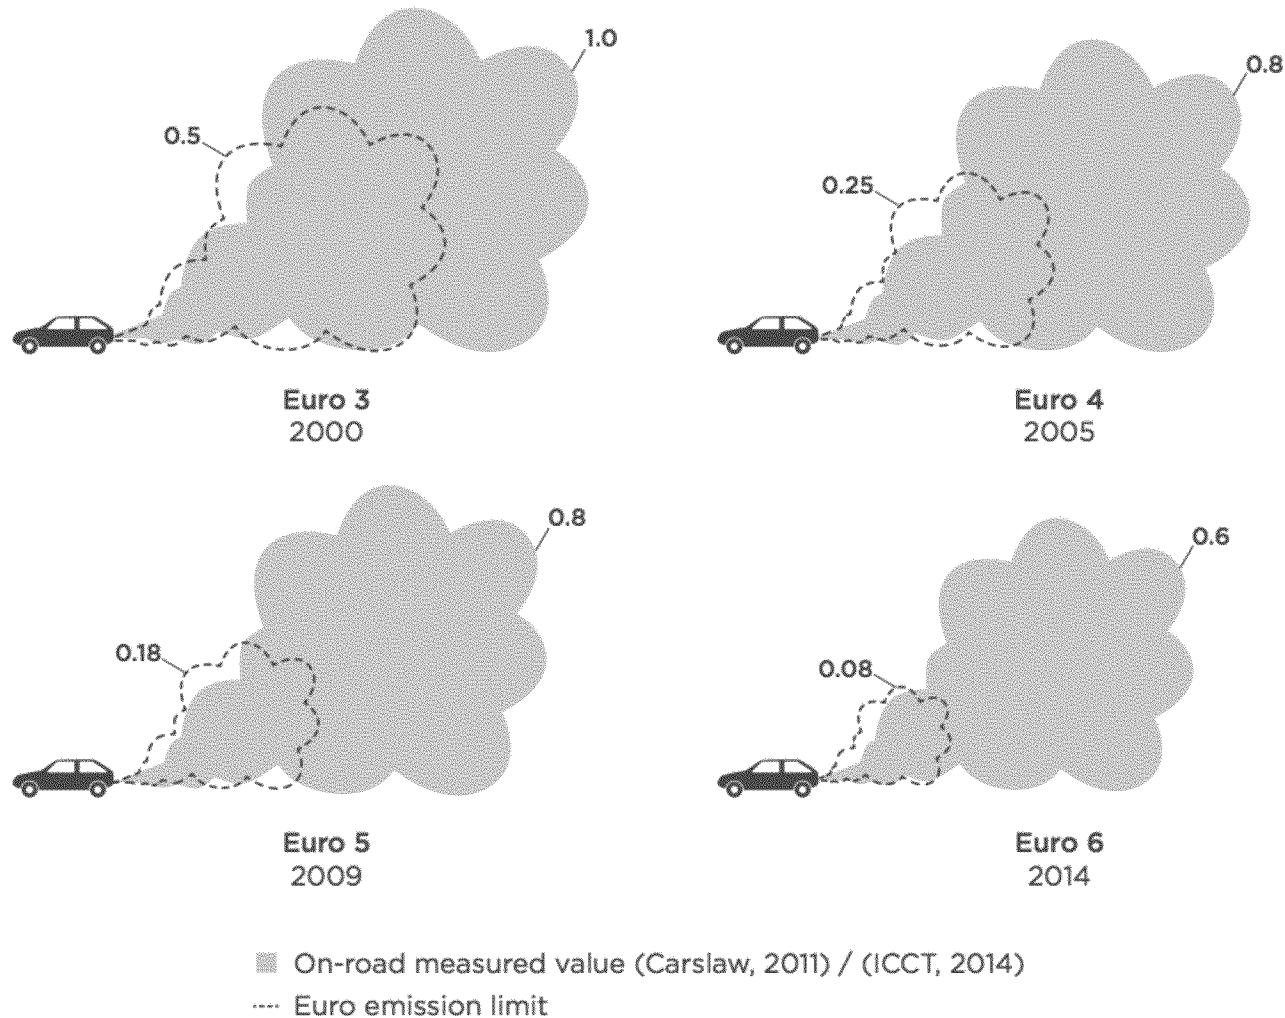

<http://www.theicct.org/real-world-exhaust-emissions-modern-diesel-cars>

ICCT PEMS meta-analysis : NO_x conformity factors

(all vehicles and all trips)

LDDV NOx emission limits reduced by 85% Euro 3 to Euro 6, but on-road emissions reduced only by 40%

Source for Euro 3 to Euro 5: Carslaw et al. (2011). Recent evidence concerning higher NO_x emissions from passenger cars and light duty vehicles. *Journal of Atmospheric Environment* 45 (2011) 7053-7063.

Off-cycle, real world NOx emissions are not following the reduction trends set by standards

ICCT Data – US

- Vehicle A = Vehicle H in compiled data report
- Vehicle B = Vehicle F in compiled data report
- Vehicle C = Vehicle B in compiled data report

In-use NOx problem is likely calibration, not hardware, related:

- Vehicle C maintained excellent in-use NOx except going uphill
- Vehicles A and B passed FTP and Euro6 standards on chassis dyno

Europe's RDE-LDV process

What is it?

- An amendment to Euro 6 standards to make on-board (PEMS) testing **part of type-approval**
- Stakeholder working group is trying to define boundary conditions and how the data should be analyzed and reported
- Pilot phase to start in 2015, implementation in 2017
- Likely driver of changes in Diesel NO_x aftertreatment; implications on small Diesel PC market

Implications

- FTP/NEDC are inadequate for diesel NOx control
 - Need higher loads and more transient operation
 - Europe adoption of WLTP starting in 2017 will help:
 - But is the WLTC adequate?
 - What about the rest of the world following Euro standards?
- In-use testing and/or defeat device requirements are essential
 - US routinely conducts in-use testing and has defeat device requirements
 - Europe in the process of adopting PEMS requirements via Real Driving Emissions (RDE) process
- US06 NOx standards are not stringent enough

Closing Thoughts

Main messages

- Very clean vehicle technologies are already cost-effective and costs will continue to decline
- Standards are effective at bringing health and climate benefits
- Despite progress in developed countries, current penetration of best-practice standards in developing countries is insufficient to limit the worsening in health impacts
- Good standard design should ensure that the gap between real-world and certified emissions stays small

Policy trends

- Over the next five years, major vehicle markets are likely to have adopted low sulfur diesel fuel (< 50 ppm), Euro VI or better vehicle emission standards, and robust fuel economy standards
- Greater focus on real world driving emissions – both conventional pollutants and CO2 emissions
- Confluence of climate science and increasing levels of urban air pollution will draw regulatory attention to diesel particles
- Fuel quality will play a major role in determining the effectiveness of diesel aftertreatment technologies – second tier markets may opt for 50 ppm rather than 10 ppm
- Future international agreements are likely to include elements of transportation policies that will influence national and local level policies

Thank you for your attention!
